

Installing Norton AntiVirus for Macintosh

- 1) Go to the Applications Server and run the Norton AntiVirus 7.0 Installer located in the Norton Antivirus 7.0 folder.
- 2) When the Norton logo appears, click Continue. Click Accept to accept the license agreement, then click Continue again.
- 3) Perform the Easy Install by clicking on Install.
- 4) When the Set Scanning Preferences window comes up, accept the defaults: Standard Protection, and Scan Stuffit format only.
- 5) When prompted, click Quit to end installation.
- 6) In your newly created Norton AntiVirus Folder, click on Norton AntiVirus to configure the application.

- 7) To scan a disk, click on the disk on the left and select Scan/Repair. It is a good idea to do this after your initial installation, however it can take a while. You may want to start the process before lunch or before leaving for the day.

- 8) Click on the Live Update button to have your computer check periodically for new virus definitions. Click on Live Update Scheduler. A window like this will open:

- 9) Schedule your live updates to run weekly at time that is convenient to you. When finished click Done the quit Norton.
